## 2. Short annotation to the course

General characteristics, short course description, peculiarities, advantages

Teaching of *Biological chemistry* at the medical faculty (for foreign students) in Danylo Halytsky Lviv National Medical University is provided during the second year of training.

General characteristics, short course description, peculiarities, advantages.

Biological chemistry belongs to the fundamental medical disciplines. Knowledge of biochemical processes occurring at different levels of the organization - cellular, organ, tissue and whole body - is necessary for medical students to understand the metabolic processes of metabolism, energy, the course of decomposition and synthesis reactions, transmission of hereditary information, processes that ensure the course of physiological functions, and for the interpretation of biochemical parameters for diagnostic or prognostic purposes in clinical practice.

Types of educational activities for students according to the curriculum are lectures, practical classes and students individual work (SIW).

Biological chemistry as a discipline:

- a) is based on the study of medical biology, biophysics, medical chemistry (bioinorganic, physical and colloid chemistry), morphological disciplines by students and integrates with these disciplines;
- b) lays the foundations for students to study molecular biology, genetics, physiology, pathology, general and molecular pharmacology, toxicology and propaedeutics of clinical disciplines, which involves the integration of teaching with these disciplines and the formation of skills to apply knowledge of biological chemistry, especially biochemical processes in the body of a healthy and sick person, in the process of further training and professional activities;
- c) lays the foundations for clinical diagnosis of the most common diseases, monitoring the course of the disease, monitoring the effectiveness of drugs and measures aimed at preventing the occurrence and development of pathological processes;
- d) further improvement of skills to use theoretical and practical skills in pathobiochemistry should be carried out at a higher scientific and methodological level in a separate training course "Clinical Biochemistry", which is taught as an elective course for 3 year students and which is desirable to be taught as mandatory at 5 6 courses, ie after completion of the study of the main clinical disciplines and therapeutic and surgical cycles.

## 3. Aim and scope of the course

- 1. The purpose of teaching the discipline "Biological Chemistry" is to master the results of biochemical research and changes, biochemical and enzymatic indicators used to diagnose human diseases; to analyze the biochemical processes of metabolism and its regulation in ensuring the functioning of organs and systems of the human body. The ultimate goal is to acquire practical skills.
- 2. The objectives of the discipline "Biological Chemistry" are to master the skills to detect biochemical components in biological fluids and analyze the results of biochemical investigations and changes in biochemical, in particular, enzymatic parameters used to

diagnose the most common human diseases.

3. Competences and learning outcomes, the formation of which provides the study of the discipline "Biological Chemistry" (general and special competencies).

General competencies, the formation of which provides the study of the discipline "Biological Chemistry":

- GC 1. Ability to abstract thinking, to analyze and synthesize.
- GC 2. Ability to learn and master modern knowledge.
- GC 3. Ability to apply knowledge in practical situations.
- GC 4. Ability to acquire basic general knowledge, as well as basic knowledge of the profession.
- GC 5. Ability to adapt and act in a new situation.
- GC 6. Ability to make grounded decisions.
- GC 7. Ability to work in a team.
- GC 8. Ability to interpersonal interaction.
- GC 9. Ability to communicate in a foreign language.
- GC 10. Ability to use information and communication technologies.
- GC 11. Improve the ability to manage information from various sources.
- GC 12. Certainty and persistence on the tasks and duties taken.
- GC 15. Ability to preserve and multiply moral, cultural, scientific values and achievements of society based on the understanding of history and development of the subject area, its place in the general system of knowledge about nature and society and in the development of society, technics and technology, use different types and forms of activity for active recreation and leading a healthy lifestyle.

Professional (special, subject):

- PC1. Ability to collect medical information about the patient and analyze clinical data.
- PC2. Ability to determine the list of laboratory and instrumental studies necessary for patiens and evaluate their results.
- PC 3. Ability to establish a preliminary and clinical diagnosis of the disease.
- PC 7. Ability to diagnose emergency conditions.
- PC 17. The ability to assess the impact of the environment, socio-economic and biological factors on the state of health of an individual, family, population.
- PC 21. Clearly and unambiguously convey one's own knowledge, conclusions and arguments on health care problems and related issues to specialists and non-specialists, in particular to people who are studying.
- PC 23. The ability to develop and implement scientific and applied projects in the field of health care.
- PC 24. Adherence to ethical principles when working with patients and laboratory animals.
- PC 25. Adherence to professional and academic integrity, to be responsible for the reliability of the obtained scientific results.

Integrative final program results of training (PRN), the formation of which is favored by the educational discipline:

- PRN1. To have thorough knowledge of the structure of professional activity. To be able to carry out professional activities that require updating and integration of knowledge. To be responsible for professional development, the ability for further professional training with a high level of autonomy.
- PRN2. Understanding and knowledge of fundamental and clinical biomedical sciences, at a level sufficient for solving professional tasks in the field of health care.
- PRN3. Specialized conceptual knowledge that includes scientific achievements in the field of health care and is the basis for conducting research, critical understanding of problems in the field of medicine and related interdisciplinary problems.
- PRN4. Highlight and identify leading clinical symptoms and syndromes (according to list 1); according to standard methods, using preliminary data of the patient's

- history, data of the patient's examination, knowledge about the person, his organs and systems, establish a preliminary clinical diagnosis of the disease (according to list 2).
- PRN5. Collect complaints, anamnesis of life and illness, assess the psychomotor and physical development of the patient, the state of organs and systems of the body, based on the results of laboratory and instrumental studies, evaluate information regarding the diagnosis (according to list 4), taking into account the age of the patient.
- PRN6. To establish the final clinical diagnosis by making a reasoned decision and analyzing the received subjective and objective data of clinical, additional examination, carrying out differential diagnosis, observing the relevant ethical and legal norms, under the control of the head physician in the conditions of the health care institution (according to the list 2).
- PRN7. To assign and analyze additional (mandatory and optional) examination methods (laboratory, functional and/or instrumental) (according to list 4) of patients with diseases of organs and body systems for differential diagnosis of diseases (according to list 2).
- PRN8. To determine the main clinical syndromes or causes the severity of the victim/injured's condition (according to list 3) by making a reasoned decision and assessing the person's condition under any circumstances (in the conditions of a health care facility, outside its borders), including in the conditions of an emergency and hostilities, in field conditions, in conditions of lack of information and limited time.
- PRN21. To search for the necessary information in the professional literature and databases of other sources, analyze, evaluate and apply this information.
- PRN22. To apply modern digital technologies, specialized software, and statistical methods of data analysis to solve complex healthcare problems.
- PRN 23. Assess the impact of the environment on the state of human health in order to assess the state of morbidity of the population.
- PRN24. To organize the necessary level of individual safety (own and the persons he cares for) in case of typical dangerous situations in the individual field of activity.
- PRN25. It is clear and unambiguous to convey one's own knowledge, conclusions and arguments on health care problems and related issues to specialists and non-specialists.
- PRN27. Communicate freely in English language, both orally and in writing to discuss professional activities, research and projects.

## 4. Prerequisites of the course

(Indicates information on disciplines, basic knowledge and learning outcomes required by the student (enrolled) for successful study and acquisition of competencies in this discipline)

For successful training and mastering of key competencies in the discipline "Biological Chemistry" it is necessary to have basic knowledge in the following disciplines:

- 1. Medical biology structure of viruses, prokaryotic cells, eukaryotes, subcellular structure of cells, structural and functional significance of organelles, basics of molecular biology, functional components and stages of replication, transcription, translation into prokaryotes and eukaryotes, transcripton structure of the operon induction and repression by Jacob and Mono. Structure, properties, classification of simple and complex enzymes. Fundamentals of enzymatic kinetics. The concept of metabolism, stages of anabolism and catabolism. The main ways of metabolism of proteins, carbohydrates, lipids, nucleic acids.
- 2. Biophysics osmolarity, osmolality, osmosis, turgor, active transport, diffusion, facilitated diffusion, electrolytes, rest and action potentials, optical activity, fluorescence, salinization, denaturation, electrophoresis, chromatography, gel filtration, enzyme-linked immunosorbent assay.
- 3. Organic chemistry the structure and properties of organic acids, amino acids, proteins,

chromoproteins, nucleoproteins, monosaccharides, disaccharides, homopolysaccharides, heteropolysaccharides, heparin, glucosamine glycans, hyaluronic acid, hyaluronic acid, sialoic acid, nucleosides, nucleotides, nucleic acids. Features of secondary, tertiary, quaternary structures of proteins and nucleic acids. Structure and properties of water-soluble and fat-soluble vitamins, vitamin-like substances, hormones derived from amino acids, protein-peptide, steroid, thyroid, hormone-like substances derived from arachidonic acid.

- 4. Anatomy the structure of the nervous, endocrine, digestive, cardiovascular, excretory, circulatory, immune, connective, muscular, skeletal systems.
- 5. Physiology structural and functional features of the nervous, endocrine, digestive, cardiovascular, excretory, circulatory, immune, connective, muscular, skeletal systems.

It is necessary to provide the system of the classes organization, the use of interactive methods, educational technologies that are used for the transfer of knowledge and skills.

# 8. Verification of learning results

# **Current control**

is carried out during training sessions and aims to check the assimilation of students of educational material (it is necessary to describe the forms of current control during training sessions). Forms of assessment of current educational activities should be standardized and include control of theoretical and practical training. The final grade for the current educational activity is set on a 4-point (national) scale.

|                                 | exam includes the following steps:   | assessment of test tasks and the                                 |  |  |  |
|                                 | 1) Compilation of a test control, which                                    | assessment of theoretical tasks                                  |  |  |  |
|                                 |  | assessment of theoretical tasks                                  |  |  |  |

contains 40 tasks with one correct answer. This stage - 40 minutes (1 test - 1 minute). 10 options.

2) Compilation of a theoretical task, which contains 5 tasks: 4 tasks from different sections of the discipline "Biological Chemistry", 5th task - reflects the level of mastery of practical skills.

(including practical skills).

Criteria of evaluation of the examination test tasks:

Less than 25 tests - "unsatisfactory";

25 - 30 tests - "satisfactory";

31 - 36 tests - "**good**";

37 - 40 tests - "**excellent**".

The correct answer to 1 test is 1 point. The minimum number of points for 40 tests is 25 points.

The maximum number of points for 40 tests is 40 points.

Criteria for evaluating theoretical tasks: Each of the five theoretical tasks is evaluated from 5 to 8 points:

Less than 5 points - "unsatisfactory";

5 points - "satisfactory";

7 points - "good";

8 points - "excellent".

The minimum number of points for 5 theoretical tasks is 25 points. The maximum number of points for 5 theoretical tasks is 40 points.

For theoretical questions the student receives:

Assessment "excellent", if without errors he answered written theoretical tasks (including practical skills), substantiated the results, ie: comprehensively and deeply mastered the curriculum; has full theoretical knowledge and practical skills
Assessment of "good" if you made some minor mistakes in answering written theoretical tasks (including practical skills), but did not fully substantiate the data obtained

Assessment "**satisfactory**" if significant errors were made in answering written theoretical tasks (including practical skills).

Assessment "**unsatisfactory**" if you made gross mistakes in answering written tasks or did not answer them at all.

For the exam the student receives: A grade of "**excellent**" (75 - 80 points) is given to a student who gave correct answers to 37 - 40 standardized tests, without errors answered written theoretical tasks (including practical skills), substantiated the results (38 - 40 points), ie: comprehensively and deeply mastered the curriculum; has full theoretical knowledge and practical skills

A grade of "**good**" (62 - 74 points) is given to a student who gave correct answers to 31 - 36 standardized tests, made some minor mistakes in answering written theoretical tasks (including practical skills), but did not fully substantiate the data obtained (31 - 37 points).

A grade of "satisfactory" (50 - 61 points) is given to a student who gave correct answers to 25 - 31 standardized tests, made significant mistakes in answering written theoretical tasks (including practical skills) (25 - 30 points).

A grade of "unsatisfactory" is given to a student who gave correct answers to less than 25 standardized tests, made gross errors in answering written tasks or did not give answers to them at all.

The maximum number of points that a student can score when taking the exam is 80.

The minimum number of points in the exam - not less than 50.

The grade for the exam consists of the assessment of test tasks and the assessment of theoretical tasks (including practical skills).

The **maximum number** of points that a student can score when taking the exam is **80**.

The **minimum number** of points in the exam - not less than **50**.

The maximum number of points that a student can score for the current academic activity for admission to the exam (differentiated test) is 120 points.

The minimum number of points that a student must score for the current academic activity for admission to the exam (differentiated test) is 72 points.

The calculation of the number of points is based on the grades obtained by the student on a 4-point (national) scale during the study of the discipline, by calculating the arithmetic mean (CA), rounded to two decimal places. The resulting value is converted into points on a multi-

$$x = \frac{\text{CA} \times 120}{5}$$

point scale as follows:

# Criteria for assessing an objective structured practical (clinical) exam / Complex of practice-oriented exam

## Master's thesis

## 9. Policy of the course

The policy of the course is determined by the system of requirements for the student in the study of the discipline "Biological Chemistry" and is based on the principles of academic integrity. Students are explained the value of acquiring new knowledge, the need for independent performance of all types of work, tasks provided by the work program of this discipline. Lack of references to used sources, fabrication of sources, writing off, interference in the work of other students are examples of possible academic dishonesty. Detection of signs of academic dishonesty in the student's work is the basis for its non-enrollment by the teacher, regardless of the extent of plagiarism or deception. Literary sources may be provided by the teacher exclusively for educational purposes without the right to transfer to third parties. Students are encouraged to use other literature sources not provided by the recommended list.

## **Information resources:**

1. Centre of testing – base of licenced test tasks Krock-1 htpp://testcentr.org.ua/

## 1. Equipment, material and technical supply

# **Methodical supply:**

- 1. Working educational program of the discipline;
- 2. Multimedia lectures supply;
- **3.** Lectures theses:
- **4.** Methodical recommendations for the lecturers;
- 5. Educational platform Misa;
- 6. Study guides:
- 7. Methodical guides to the practical classes for students;
- **8.** Methodical instruction for the students independent work;
- **9.** Test and control tasks to practical classes;
- **10.** Questions and tasks for the summary control (exam);
- 11. Laboratory equipment (PEC, SP, centrifuges, laboratory utensils, biochemical analyzers)

## 12. Optional information

 $Responsible \ for \ the \ educational \ work \ with \ for eign \ students-Prof. \ Iryna \ Fomenko$ 

Practical classes and lectures are delivered in the Department classrooms at the address: Lviv, 69, Pekarska Street, Chemical building, ground floor.

Web-site of the Department - e-mail: Kaf biochemistry@meduniv.lviv.ua

#### **Syllabus elaborators**

Iryna FOMENKO, PhD, DrSci, Prosessor

(Signature)

# **Head of the Department**

Lesia KOBYLINSKA, PhD, DrSci, Prosessor
